### 21 Computational aspects of resilient data extraction from semistructured sources (extended abstract) 80%

Hasan Davulcu , Guizhen Yang , Michael Kifer , I. V. Ramakrishnan

**Proceedings of the nineteenth ACM SIGMOD-SIGACT-SIGART symposium on Principles of database systems** May 2000

Automatic data extraction from semistructured sources such as HTML pages is rapidly growing into a problem of significant importance, spurred by the growing popularity of the so called "shopbots" that enable end users to compare prices of goods and other services at various web sites without having to manually browse and fill out forms at each one of these sites. The main problem one has to contend with when designing data extraction techniques is that the contents of ...

### 22 Indexing and retrieval of scientific literature 80%

Steve Lawrence , Kurt Bollacker , C. Lee Giles

**Proceedings of the eighth international conference on Information and knowledge management** November 1999

The web has greatly improved access to scientific literature. However, scientific articles on the web are largely disorganized, with research articles being spread across archive sites, institution sites, journal sites, and researcher homepages. No index covers all of the available literature, and the major web search engines typically do not index the content of Postscript/PDF documents at all. This paper discusses the creation of digital libraries of scientific literature on the web, incl ...

### 23 Training a selection function for extraction 80%

Chin-Yew Lin

**Proceedings of the eighth international conference on Information and knowledge management** November 1999

In this paper we compare performance of several heuristics in generating informative generic/query-oriented extracts for newspaper articles in order to learn how topic prominence affects the performance of each heuristic. We study how different query types can affect the performance of each heuristic and discuss the possibility of using machine learning algorithms to automatically learn good combination functions to combine several heuristics. We also briefly describe the design, implementa ...

- 28** Experiences with selecting search engines using metasearch 80%  
 Daniel Dreilinger , Adele E. Howe  
**ACM Transactions on Information Systems (TOIS)** July 1997  
Volume 15 Issue 3  
Search engines are among the most useful and high-profile resources on the Internet. The problem of finding information on the Internet has been replaced with the problem of knowing where search engines are, what they are designed to retrieve, and how to use them. This article describes and evaluates SavvySearch, a metasearch engine designed to intelligently select and interface with multiple remote search engines. The primary metasearch issue examined is the importance of carefully selecti ...

**Proceedings of the first international joint conference on Autonomous agents and multiagent systems: part 3** July 2002  
In this paper, we present CoMMA (Corporate Memory Management through Agents), an open, agent-based system for the management of a corporate memory that was realized integrating several emerging technologies: agent technology, knowledge modeling, XML technology, information retrieval and machine learning techniques. In particular, the system has been realized to help users in the management of an organization corporate memory and in particular to facilitate the creation, dissemination, transmissi ...
- 31** Corpus Linguistics: Mining the web to create minority language corpora 80%  
 Rayid Ghani , Rosie Jones , Dunja Mladenić  
**Proceedings of the tenth international conference on Information and knowledge management** October 2001  
The Web is a valuable source of language specific resources but the process of collecting, organizing and utilizing these resources is difficult. We describe CorpusBuilder, an approach for automatically generating Web-search queries for collecting documents in a minority language.

It differs from pseudo-relevance feedback in that retrieved documents are labeled by an automatic language classifier as relevant or irrelevant, and this feedback is used to generate new queries. We experiment with var ...

### 32 PVA

80%

Chien Chin Chen , Meng Chang Chen , Yeali Sun

**Proceedings of the seventh ACM SIGKDD international conference on Knowledge discovery and data mining** August 2001

In this paper, we present PVA, an adaptive personal view information agent system to track, learn and manage, user's interests in Internet documents. When user's interests change, PVA, in not only the contents, but also in the structure of user profile, is modified to adapt to the changes. Experimental results show that modulating the structure of user profile does increase the accuracy of personalization systems.

### 33 P11: Finding scientific papers with homepage search and MOPS

80%

Gerd Hoff , Martin Mundhenk

**Annual ACM Conference on Systems Documentation** October 2001

The fast dissemination of new research results on the world-wide web poses new challenges for search engines. In this paper we describe a new approach to seek scientific papers relevant to a pre-defined research area. Different from other approaches, we do not search for web pages which contain certain keywords, but we search for web pages which are created by scientists who are active in the research area under consideration. The names of these scientists are obtained from the DBLP server [9]. ...

### 37 Knowledge-based metadata extraction from PostScript files

80%

Giovanni Giuffrida , Eddie C. Shek , Jihoon Yang

**Proceedings of the fifth ACM conference on Digital libraries** June 2000

The automatic document metadata extraction process is an important task in a world where thousands of documents are just one "click" away. Thus, powerful indices are necessary to support effective retrieval. The upcoming XML standard represents an important step in this direction as its semistructured representation conveys document metadata together with the text of the document. For example, retrieval of scientific papers by authors or affiliations would be a s ...

### 38 A learning agent for wireless news access

80%

Daniel Billsus , Michael J. Pazzani , James Chen

**Proceedings of the 5th international conference on Intelligent user interfaces** January 2000

We describe a user interface for wireless information devices, specifically designed to facilitate

learning about users' individual interests in daily news stories. User feedback is collected unobtrusively to form the basis for a content-based machine learning algorithm. As a result, the described system can adapt to users' individual interests, reduce the amount of information that needs to be transmitted, and help users access relevant information with minimal effort.
